Living Hoardings a temporary solution

Mobilane Living Hoardings provide a solution which satisfies environmental and social sustainability requirements, improves air quality, low maintenance including the reduction of PM10s, and which delivers a wide range of further benefits including; security, aesthetics, , ease of installation. The Hoardings also provide a deterrent against graffiti and other anti-social behaviour.

Mobilane Living Hoardings are a simple but remarkably effective concept. The Hoardings consist of a 5mm thick carbon galvanized steel weld mesh fence and a biodegradable pot into which vegetation, usually ivy, is cultivated. The growing plants are wound around the steel structures in nurseries until the planting reaches the full height of the frame. The fully grown Hoarding is then delivered ready to install.

The ivy can grow up to the height of the hoarding if required but can be maintained at a set height if so desired. The Living Hoarding also provides a significantly tough barrier which deters intruders.

Key advantages

- Instant greening solutions for short- and long-term applications.
- Dust suppression equal to a mature street tree for every 9 screens installed.
- Cost-effective solution. Clients pay for the hoardings for the time they are required. There is no need to maintain or to store them when they are no longer in use.
- No waste disposal.
